What is a magnetic generator?

A magnetic generator is a device that converts mechanical energy into electrical energy using the principles of magnetic fields and electromagnetic induction. It consists of a rotor, which is usually a set of permanent magnets, and a stator with coils of wire.

How does a magnetic generator work?

In a generator, a magnet is rotated within a coil of wire, causing the magnetic field to change. This change in the magnetic field induces a current in the wire, which can then be harnessed as electrical energy. DIY magnetic generators are a popular choice for those looking to generate their own electricity at home.
