What is the temperature coefficient of a solar panel?

The temperature coefficient is expressed as a negative percentage per degree Celsius ( $^{\circ}\text{C}$ ), and it's measured relative to a solar panel temperature of  $25^{\circ}\text{C}$ . This table ranks solar panels by how well they handle heat, from the best temperature coefficient to the worst. For more specifications on these models, see our solar panel comparison table.

Do solar panels hate heat?

Solar panels love sunshine, but they hate heat - as they heat up, they produce a little less power. The temperature coefficient is expressed as a negative percentage per degree Celsius ( $^{\circ}\text{C}$ ), and it's measured relative to a solar panel temperature of  $25^{\circ}\text{C}$ .

How efficient are solar panels in hot weather?

In hot weather, solar panels have decreased efficiency, so starting out with a higher efficiency panel is important for maintaining production. The average solar panel efficiency is about 20%, but we recommend choosing a panel brand with an efficiency above 20% to account for losses due to heat.

What is a solar panel's temperature coefficient ( $P_{\text{max}}$ )?

Image Credit: Proven Energy & SAE Group Brisbane South A solar panel's temperature coefficient ( $P_{\text{max}}$ ) measures the loss in power output when the panel gets hot. Solar panels love sunshine, but they hate heat - as they heat up, they produce a little less power.
