

Solar panels to electric heating

How do solar panels work?

Solar panels on your roof convert sunlight directly into electricity. This electricity can then be used to power various types of electric heating systems in your home. For example, modern, efficient electric radiators can be turned on during sunny periods to utilise your free solar energy.

How do solar panels convert sunlight into electricity?

Solar PV panels convert sunlight into electricity through a process called the photovoltaic effect. Solar panels on your roof convert sunlight directly into electricity. This electricity can then be used to power various types of electric heating systems in your home.

Can solar PV panels heat your home with electric radiators?

If you have the financial means and the inclination to go green with your energy, then it's very possible to harness enough power from the sun using solar panels to heat your home with electric radiators comfortably. In this article we'll look at how pairing Solar PV panels with electric radiators could be a great option for you.

Can I use solar power for my heating system?

Even if you have a combustion heater, solar power can be used by the electrical components of the heating system. If the installation is combined with a home battery and an insulated tank, you can store electricity and hot water for blackouts. This feature is very useful if a winter storm causes extended blackouts in your area.
