

Types of elb in aws

What are the different types of load balancers in AWS?

AWS offers four types of load balancers: Classic Load Balancer (CLB), Application Load Balancer (ALB), Network Load Balancer (NLB), and Gateway Load Balancer (GWLB), each designed for specific use cases and protocols. One of the key features of Elastic Load Balancers in AWS is Health Checks.

What is elastic load balancer (Elb) on AWS?

Elastic Load Balancing automatically distributes incoming application traffic across multiple targets, such as Amazon EC2 instances, containers, and IP addresses. Network traffic can be distributed across a single or multiple Availability Zones (AZs) within an AWS Region. There are four types of Elastic Load Balancer (ELB) on AWS:

What are the different types of Elbs?

Understanding the three main types of ELBs--Application Load Balancer (ALB), Network Load Balancer (NLB), and Gateway Load Balancer (GWLB)--is crucial for choosing the right load balancing solution based on your application's needs.

What types of traffic does Elb support?

ELB supports HTTP, HTTPS, TCP, and UDP traffic. There are different types of load balancers: Application Load Balancer (ALB), Network Load Balancer (NLB), and Classic Load Balancer (CLB). ALB is ideal for web applications, while NLB is for high-performance, low-latency traffic. ELB scales automatically based on incoming traffic demands.
